# Tech Stack Scout · Engineering Research for Sales — Components Map

| Actor | Trigger | Input | Context | Processing | AI | Output |
|---|---|---|---|---|---|---|
| **Code & Schedule** (GitHub, Vercel Cron) | Code on GitHub deploys to Vercel. Cron runs daily 3 AM UTC and re-researches any company older than 6 days (weekly). | | | | | |
| **Nikhil** (Account executive) | Types a company in New research (auto-suggest fills the website) or clicks Refresh now on a report. | | | | | |
| **Public Sources** (GitHub, job boards, Google) | | Live public data: GitHub repos and languages, official job posts, engineering blogs and talks, the company website. | | | | |
| **Database** (Supabase Postgres) | | | Watchlist and FlowForge's target profile. Last good evidence is kept if a source fails this week. | | | |
| **Evidence & Scoring** (Rules in code) | | | | Each finding gets a source link, date, tier and confidence. Gaps are listed. Fit score 0–100 is set in code. | | |
| **AI Writer** (Gemini Flash) | | | | | Writes a 2-paragraph summary and one opening line using only cited evidence. Never sets the score. | |
| **System** (App on Vercel) | | | | Checks the AI text: the line must cite strong evidence; unknown tools are rejected. Saves report and run log. | | |
| **Dashboard** (Next.js on Vercel) | | | | | | Watchlist ranked by fit. Report: opening line with its source, summary, evidence, score, history. |
| **People** (Nikhil, the sales call) | | | | | | Nikhil copies the line, edits or rewrites it, logs outreach. Nothing is ever sent to the prospect. |

Dashed arrows follow one company from request to Nikhil's screen. Red boxes are what Nikhil does or sees.

Facts come only from public sources, scores are computed in code, and Gemini Flash only writes text. If there's no engineering evidence, there's no score and the report explains why.
